Key to ZVI colour bands

- 0-20% of target points visible
- 20-40% of target points visible
- 40-60% of target points visible
- 60-80% of target points visible
- 80-100% of target points visible

Notes

1. The ZVI model computes visibility to a 100m x 100m grid of target points across the proposed development site.
2. Theoretical intensibility (number of target points visible) is computed within all 50m x 50m grid squares within 0.5 km radius of each target point.
3. Theoretical intensibility within the development site does not take account of proposed development within the site.
